This User ' s Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User ' s Guide was created by researchers affiliated with AHRQ ' s Effective Health Care Program, particularly those who participated in AHRQ ' s DecIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

REDCap audits in the EPIC TM electronic health record (EHR) have increased the efficiency and usefulness of inpatient clinical nursing audits at Children ' s Hospital in Aurora Colorado (1). The preponderance of EPIC institutions do not use an electronic data capture for departmental audits or nursing purposes. Most institutions that use EPIC EHR employ REDCap as a research tool, or for surveying individuals. This thesis demonstrates a proof of concept for the creation of a hypothetical mAudit, a mobile clinical audit for nursing compliance. The mAudits are based on " paper " nursing audits used by a single institution in the Greater San Francisco area, which uses EPIC as the EHR in both inpatient and outpatient settings. Presently, manual paper audits are used for validation of nursing best practice care compliance and quality assurance for outcome measures. The nursing audit data has been manually extracted from the EHR, and hand notated daily to a paper record. Additionally nursing audits use observational validation to verify compliance of nursing best practice policies and standardized care bundles (2). The combination of manual data extraction and observational collection can overlook data, and is subject to transcription errors (3). Paper based audits provide limited opportunity for real-time staff remediation. Paper audits cannot readily distinguish between timely nurse interventions and those executed more slowly, which can readily affect patient outcomes. For this proof of concept, three audit forms have been adapted for use in a REDCap format. REDCap can be configured to retrieve patient data from the EHR and push data to a secure HIPAA compliant mobile device such as an iPad, or iPhone. Automated EHR data retrieval can constantly update admit transfer & discharge (ADT) information, data from vital sign monitors, and clinician entered shift assessment data. Trained nursing auditors could use mAudits to directly validate EHR care data, confirm second tier review safety, and to monitor real-time patient, equipment, and environmental room safety. After observational data has been entered into a mobile platform, a " mAudit " can be used to address gaps in care, second tier review, immediately available for use in the real-time shift huddles, and subsequently used for actionable secondary use actionable administrative use. REDCap audits can be formatted to provide attestation trails for Meaningful Use (MU) Stage 3 for hospital compliance (4). Attestation is particularly desirable for hospital entities, which have had detrimental findings upon CMS or JACHO audit and now must prove a course of corrective action. REDCap was already in use in the organization upon which this thesis has been conceptualized from, and these finding could be immediately be implemented with a minimal output of resources. A health or nursing informaticist could design audits appropriately tailored to unit specificity, and the REDCap team could adapt this project ' s recommendations for a nationwide compliance with homogeneity of data populated by an organization and provide data, which could be used for a longitudinal study following individual patients throughout encounters. Additionally, this type of audit format could be used in multiple, fractal, healthcare settings for patient populations with chronic conditions whom require long-term post acute care.

This book provides an overview of the challenges in electronic health records (EHR) design and implementation along with an introduction to the best practices that have been identified over the past several years. The book examines concerns surrounding EHR use and proposes eight examples of proper EHR use. It discusses the complex strategic planning that accompanies the systemic organizational changes associated with EHR programs and highlights key lessons learned regarding health information—including technology errors and risk management concerns.

INTRODUCTION TO MEDICAL PRACTICE MANAGEMENT uses a unique, two-tiered approach in each unit to help students become successful managers in any medical office setting. The first chapter in each unit introduces students to the basics of medical practice management and the roles of each staff member within the healthcare facility. The second chapter of each unit covers the skills and responsibilities of the manager in relation to the topics being covered. From personnel management to compliance with regulatory agencies, students must first understand the fundamentals of managing the medical office in order to develop the expertise they need to successfully teach staff, train new personnel, and audit procedures that occur in daily practices. Numerous examples of letters, procedural policies, and forms are included for hands-on learning. Students will also have the opportunity to practice the skills they are learning as they create their own practice with the Think Like a Manager feature at the end of each unit and the accompanying templates provided in the back of the book. Information technology is revolutionizing healthcare, and the uptake of health information technologies is rising, but scientific research and industrial and governmental support will be needed if these technologies are to be implemented effectively to build capacity at regional, national and global levels. This book, "Improving Usability, Safety and Patient Outcomes with Health Information Technology", presents papers from the Information Technology and Communications in Health conference, ITCH 2019, held in Victoria, Canada from 14 to 17 February 2019. The conference takes a multi-perspective view of what is needed to move technology forward to sustained and widespread use by transitioning research findings and approaches into practice. Topics range from improvements in usability and training and the need for new and improved designs for information systems, user interfaces and interoperable solutions, to governmental policy, mandates, initiatives and the need for regulation. The knowledge and insights gained from the ITCH 2019 conference will surely stimulate fruitful discussions and collaboration to bridge research and practice and improve usability, safety and patient outcomes, and the book will be of interest to all those associated with the development, implementation and delivery of health IT solutions.

This text provides a concise, yet comprehensive overview of telemedicine in the ICU. The first part of the book reviews common issues faced by practitioners and hospital administrators in implementing and managing tele-ICU programs, including the merits of different staffing models, the challenges of building homegrown programs versus contracting for services, and the impact of state laws and payer policies on reimbursement for tele-ICU services. The second part of the book presents the current state of evidence for and against ICU telemedicine, based on clinical trials, before-and-after implementation studies, and observational data. The third part dives deeper into specific use cases for telemedicine in the ICU, including telestroke, pediatric and cardiac intensive care, and early treatment of declining patients with sepsis. Written by experts in the field, Telemedicine in the ICU is a practical guide for intensive care physicians and hospital administrators that provides all the information necessary in building and maintaining a successful tele-ICU program.
