Trans(in)fusion is a highly original book that tries to radicalize our ways of 'critical thinking' across disciplines. The book, refreshingly, brings into play critical philosophy, literary criticism, studies in mathematics, physics, chemistry and developmental biology, and various other disciplines and epistemes to set up a tenure and tenor of 'critical thinking'. The book is an exclusive intervention in how thinking across traditions and systems of thought can generate distinct interpretive experiences. It questions, in a unique transcultural and transversal bind, our ways of hermeneutic and literary-cultural thinking. Trans(in)fusion resets the dialectics between text and theory.

Introductory Transport Phenomena by R. Byron Bird, Warren E. Stewart, Edwin N. Lightfoot, and Daniel Klingenberg is a new introductory textbook based on the classic Bird, Stewart, Lightfoot text, Transport Phenomena. The authors' goal in writing this book reflects topics covered in an undergraduate course. Some of the rigorous topics suitable for the advanced students have been retained. The text covers topics such as: the transport of momentum; the transport of energy and the transport of chemical species. The organization of the material is similar to Bird/Stewart/Lightfoot, but presentation has been thoughtfully revised specifically for undergraduate students encountering these concepts for the first time. Devoting more space to mathematical derivations and providing fuller explanations of mathematical developments—including a section of the appendix devoted to mathematical topics—allows students to comprehend transport phenomena concepts at an undergraduate level.

In 1941 New York, young Joey El Bueno's world is turned upside-down when he meets the enigmatic Jane Bent, a freckle-faced girl with pigtails who seems to know him better than he knows himself, comes and goes at will, claims to have once levitated six feet off the ground and seems to only be known by Joey. By the best-selling author of Dimiter and The Exorcist. Reprint.

This book provides students with a clear and thorough presentation of the theory and application of structural analysis as it applies to trusses, beams, and frames. Emphases are placed on teaching readers to both model and analyze a structure. A hallmark of the book, "Procedures for Analysis," has been retained in this edition to provide learners with a logical, orderly method to follow when applying theory. Chapter topics include types of structures and loads, analysis of statically determinate structures, analysis of statically determinate trusses, internal loadings developed in structural members, cables and arches, influence lines for statically determinate structures, approximate analysis of statically indeterminate structures, deflections, analysis of statically indeterminate structures by the force method, displacement method of analysis: slope-deflection equations, displacement method of analysis: moment distribution, analysis of beams and frames consisting of nonprismatic members, truss analysis using the stiffness method, beam analysis using the stiffness method, and plane frame analysis using the stiffness method. For individuals planning for a career as structural engineers.
