Evaluation Of Stability Indicating

The first method depended on the quantitative densitometric evaluation of thin layer chromatograms of the drug at 284 nm using chloroform-methanol-acetic acid (7:3:0.05 v/v/v) as a mobile phase, in a concentration range of 10-30 $\mu\text{g}/\text{spot}$. The second one used the pH induced difference

Method D is a spectrodensitometric one, which depends on the quantitative densitometric evaluation of thin layer chromatogram of aceclofenac at 275 nm. Method E is RP-HPLC that depends on using methanol: water (60:40 v/v) as mobile phase at a flow rate of 1 ml/min and UV detection at 275 nm.
