Quantitative Sensory Testing In Chronic

Quantitative sensory testing (QST) is a feasible clinical method to measure responses to sensory stimuli and may be used as an indicator of neural function or altered pain sensitivity [19-21].

Quantitative Sensory Testing (QST) is a valuable method for diagnosing peripheral nervous system disorders, including chronic pain and pain related to various diseases, such as Diabetes and CRPS. QST essentially determines the sensation and pain thresholds for cold and warm temperatures, and the vibration sensation threshold by
